

Date:

Remember: kilogram is written as kg, grams as g
1kg = 1000g

3.1 Read and compare units used to measure weight

You can use a calculator for this section

1) Write each weight in grams, e.g. 4100g = 4.1kg or 4kg and 100g

0.7kg

9 ½ kg

2 ¼ kg

1.2kg

6kg

| <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> |
|----------------------|----------------------|----------------------|----------------------|----------------------|

2) Write each weight in kilograms, e.g. 200g = 0.2kg

9740g

110g

298g

7000g

4200g

|----------------------|----------------------|----------------------|----------------------|----------------------|
| <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> |
|----------------------|----------------------|----------------------|----------------------|----------------------|

3.2 Estimate and measure items and their weights

Find **seven** household items. This can be anything from washing up liquid to the tv remote control. Firstly, list the items in weight order starting with the **lightest** and ending with the **heaviest**. Next, **estimate** the weight using the right unit (g or kg). Then if you have a scale, **measure** the actual weight on the scale.

| Food | Estimated weight | Actual weight |
|------|------------------|---------------|
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
